How to enable usb debugging on android with broken screen reddit. How to enable usb debugging on android with broken/black screen. How to enable usb debugging on android with broken screen. How to enable usb debugging on android with broken display. How to turn on debugging with broken screen.

By Sarah Haynes i usb cable image by Horticulture from Fotolia.com Blackberrys can hold a lot of personal information and it can be devastating when the screen breaks, making it so you can't access that information. While there may not be much you can do about the screen except to replace the phone, there are a few things that can be tried to retrieve some of your files off the Blackberry. Connect your Blackberry to the USB cord and the USB cord to your computer. Double-click the icon on your computer's desktop for the Blackberry Desktop Manager. Select the "Back up and Restore" icon from the main menu. Then select the "Back up" option for it to begin pulling all the files on your Blackberry phone. It will look for contacts, email addresses, pictures and music files. Disconnect your Blackberry phone and turn it off. If you already have your replacement phone, put your SIM card into the new phone and power the phone on. Go to the "Phonebook" icon on your new phone. Press the "Menu" key and go to "Import contacts from SIM." This will bring over any contacts that were saved to your SIM card if you were not able to use the computer to back them up from the broken Blackberry. Connect the new Blackberry phone with the USB cord to your computer. Open the Desktop Manager and select the "Back up and restore" option. Click "Restore" for it to transfer the files pulled from your old Blackberry to your new Blackberry. [mobjc/Shutterstock.com](#) Android has a built-in screen recorder that makes it super easy to make videos of what's happening on your screen. If you didn't know about this handy feature, we'll show you how to use it. For a long time, if you wanted to make a screen recording of your Android device you needed to use a third-party app. However, Android 11 introduced a native screen recorder tool. This is a much better solution. Note: We'll be demonstrating the screen recorder tool on a Google Pixel phone, but the feature is available on Samsung Galaxy and other Android 11+ devices as well. RELATED: The Best Screen Recording and Broadcasting Software First, we'll need to move the "Screen Record" tile into the Quick Settings—if it's not already. Swipe down twice from the top of your device's screen and tap the pencil icon to edit the tile layout. On a Samsung phone, tap the three-dot menu icon and select "Edit Buttons." The tiles at the top section are in the Quick Settings area (this is flipped on a Samsung phone). Find the "Screen Record" tile, tap and hold, and then drag the tile to the top area. Lift your finger to drop the tile. Tap the back arrow in the top-left corner when you're done. Now we can actually use the screen recorder. First, go to the screen that you want to record, then pull down the Quick Settings again. Tap the "Screen Record" tile. Next, you can decide if you also want to record audio—tap the down arrow to choose between media, microphone, or both—and show your touches on the screen. Tap "Start" when you're ready and you'll see a countdown appear. When you're done recording, swipe down from the top of the screen to show the notifications and tap "Stop" on the screen recorder. That's it! The recording will be saved to the "Movies" or "Screen Recordings" folder on your device. It's very handy to be able to do this without any third-party software. It's nice to see more operating systems getting this as a native feature. RELATED: How to Screen Record on Your Chromebook Updated: 08/02/2020 by Computer Hope Debug may refer to any of the following: 1. In general, debug refers to examining and removing errors from a program's source code. For example, a developer may debug a program to see where in the code an error occurs so it can be resolved or bypassed. 2. Debug is also an MS-DOS and Windows command line command. See our debug command page for further details. Listing of computer debug routines. 3. In an FTP session, the debug command may be used to toggle debugging on and off. Related information How to use FTP from a command line. Bug, Debugger, Debugging, Error, Programming terms Ask the average Joe out there what developer options in Android are, and you're bound to get a blank stare. Indeed, most people are not aware of this rather secret menu that is part of any Android device, but it is there -- it's just buried well enough so that you accidentally stumble there. And while these options, for the most part, are truly meant for developers, Android hobbyists will often stumble upon guides that require them to go to the so-called developer options, and flip this or that switch on (usually USB debugging or performance-related tweaks). After first discovering the exact steps needed to unlock these options, most usually commit that information to their memory and no longer need a guide to tell them what to do, but you'd be surprised at just how often friends and family that are somewhat interested in messing around with their fancy new smartphone come up and ask us that very question. Well, today we thought we'd show the simple steps required to unlock the menu, just in case you've recently hopped onto the modder's train, and are looking for some action. Note: Steps below show on stock Android 4.4. KitKat, but applicable to essentially any other Android device. Open Settings and tap Display > Sleep (or Settings > Display > Screen timeout, depending on the version of Android you're using) to delay the Android Sleep timer by up to 30 minutes. You can keep your Android screen on indefinitely by installing an app such as Screen Alive. Android's Always on Display feature shows the information on the screen even when the device is sleeping. This article will walk you through the three main ways to keep the screen active on your Android smartphone or tablet. It covers instructions for changing the inactivity timer, how to use an Android app to keep the screen on, and what you need to know about the Always on Display feature. The easiest way to make your Android device's screen stay on longer is to adjust the built-in Sleep settings. The Sleep will automatically turn your Android device's screen off when it detects no activity for a set period. This limit can be extended up to 30 minutes. Open Settings. Tap Display. Tap Sleep or Screen timeout. Select how long you want your Android smartphone or tablet screen to stay on before turning off due to inactivity. The change will take effect immediately. The maximum time allowed is 30 minutes. Some version of Android also have a Screen attention feature on the Screen timeout screen that you can adjust to prevent your device from turning off if you're looking at it. If you want your Android tablet or smartphone to stay on for more than 30 minutes, you can install an app to keep the screen on indefinitely or for a longer set time, such as an hour or two. Keeping your Android device's screen on for extended periods can drain its battery, so it's a good idea to keep it plugged in and charging when doing so. There are many Android apps designed to keep the screen on, but for this example we'll use Screen Alive. It's completely free to use and works as intended. Here's how to use Screen Alive to keep your Android screen always on. After installing Screen Alive, open the app and tap Proceed. Tap the switch next to Allow modifying system settings. Return to your Android device's home screen, locate the app, and open it again. Tap the yellow bulb icon in the lower-right corner. The Always setting should be immediately activated. Tap Custom to enter a specific inactivity counter. Tap the lightbulb icon to disable Screen Alive and to return to your Android tablet or smartphone's default Sleep settings. Many Android devices have a built-in feature called Always on Display which allows for basic information, such as the time and date, to show on the screen even when it's asleep. Android's Always on Display feature uses little battery life when in use and can be useful for those who find themselves constantly tapping their smartphone to check the time. Depending on your Android device's manufacturer and the operating system being used, the setting may be called something different such as Always-on Panel, Ambient Display, Always-On Display, or Always show time and info. Your Android smartphone or tablet's Always on Display settings can usually be found within the Settings app. The setting should be able to be located by following one of the following menu routes from within the Settings app. Display > Always on Display Home screen. Lock screen & Always-On Display > Always-On Display Display > Lock screen Once found, tap the option to enable the Always on Display feature and customize the settings to your liking. FAQ How do I keep my Android screen on while charging? You can use the screen saver setting to keep your screen awake while the device is charging. Go to Settings > Display > Screen Saver and select an option, such as Photos or Colors. How do I listen to YouTube with the screen off on my Android? Access YouTube.com in a Firefox or Chrome browser window, select the menu, and choose Desktop Site. Find the video you want to listen to, open it in full-screen mode, and return to the home screen. Swipe the control center up, tap Play, and swipe the control center down for the video to play in the background. Thanks for letting us know!
